

From Passage 1

1. What does the author mean by the phrase 'sounds crazy' (line 5)? [2] *[Question Type: Use of Vocabulary]*

From the passage	Suggested answer
Many parents — maybe even the vast majority of them — will find the following proposition ludicrous : parents should never routinely monitor what their children are doing online. (lines 1-2)	a) The author believes that his view seems ridiculous to many parents because... b) his view goes against the common view that <u>good parents should monitor their children's online activities</u>. OR his view goes against the trend of what many parents believe in / are doing <u>when monitoring their children's online activities</u>.

2. In paragraph 2, how does the author illustrate that over-monitoring can cause 'more harm than good' (line 8)? [2m] *[Question Type: Use of Illustration]*

From the passage	Suggested answer
Consider the <u>use of full body CT scans</u> to check healthy humans for early signs of disease — (lines 8-9)	a) The author illustrates that over-monitoring can be more damaging than beneficial by using the example of a CT scan .
It (the CT scan) is often not recommended by doctors. The reason? Any benefits of early detection are outweighed by the invasive tests and apprehension that would come from discovering a <u>spot on your liver that you never needed to know about</u> . (lines 9-12)	b) <u>Both show</u> how looking out for signs of danger can cause needless anxiety over something innocent/trivial OR c) <u>Both can</u> lead to disproportionate responses towards activities that may turn <u>out to be entirely innocuous</u>. OR d) Intrusion without <u>finding anything meaningful / dangerous</u> (Need to show understanding of the illustration to get the mark) Any 1 for 1 mark
Similarly, examining a young person's digital activity is seldom worthwhile as most information that turns up is likely to be unnecessarily worrisome , difficult to interpret and <u>possibly benign</u> . Parents run the risk of overreacting to <u>completely harmless</u> online behaviour that they lack the context to understand. (lines 12-14)	

3. From Paragraph 3, what are the similarities between what children today and those in the past were warned about? [3m] **[Question Type: Comparison]**

From the passage	Suggested answer
Parents throughout history have always warned their children to never talk to strangers , ... (line19) (is similar to) ...children should be careful of interacting with new online 'friends' ...(line 22)	a) Firstly, both children in the past and those of today have to be wary of conversing with people unknown to them/ people they do not know . X – dropping of keyword 'talk' or 'interact' – children were told to be wary of unknown people
never believe the words of suspicious unfamiliar people who offer them candy , ...(lines 19-20) (is similar to) be careful of shady characters who hide behind the façade of a cute avatar (lines 22-23)	b) Secondly, they also have to be sceptical of questionable or dodgy figures who appear/friendly/attractive . Note: Look for what is common, rather than describing both)
and to never share their private particulars such as their address and phone number with anyone. (lines 20-21) (is similar to) be cautious of revealing too much details about themselves . (lines 23-24)	c) Lastly, both children in the past and those of today have to be vigilant of exposing too much of their personal information/data . Note: Please match your points when doing comparison questions!

4. In what ways is relying on cyber-spying an 'admission of failure'? (line 26) [2m] **[Question Type: Inferential/Paraphrasing]**

From the passage	Suggested answer
Relying on cyber-spying is an admission of failure - a failure of communication ... Are parents building a lifelong relationship of trust with their children by cyber-spying on them? (lines 26-28)	a) Firstly, relying on cyber-spying reveals that parents have not succeeded in interacting/conversing <u>with their children</u> openly . OR b) ...have not succeeded in establishing bonds where <u>their children</u> can talk to them openly . X – faith / believe are not the same meaning as trust in the context of communication. Key ideas to capture: conversing + openly. Most responses were not able to capture these ideas <u>coherently</u> . Any of a) or b) required for 1 mark.
and certainly a failure of teaching ...Are they actually helping their children make better decisions by electronically hovering over them? (lines 26-28) Parents have a duty to teach their children how to be good digital citizens , just like they are responsible for showing them how to behave appropriately offline. (lines 31-33)	c) Secondly, relying on cyber-spying reveals that parents have not succeeded in imparting to/ guiding/ equipping <u>their children</u> with the skills to make wiser choices for themselves. OR d) ...have not educated <u>their children</u> to be accountable online users / on the right online etiquette X – missing online context

5. Explain the author's italicisation of the word '*not*' in line 31. [1] **[Question Type: Use of Punctuation]**

From the passage	Suggested answer
Children need to learn how to manage their own online presence — what to say, share, download, upload and what <i>not</i> to say, share, download, and upload. (lines 29-31)	a) The italicisation is to emphasize that...(function) b) it is not just about <u>what children share online</u>, but more importantly what they do not post (context) OR c) what <u>children refrain from posting</u> is just as or more important than <u>what they actually share</u> (context) <i>a) is required alongside any of b) or c) for the full mark.</i> X – responses with the wrong emphasis e.g. <u>both</u> are important; what <u>to post</u> is just as important as what not to post

6. From Paragraph 5, what are **three** reasons the author gives for why parents should not be worried about social media? [3m] **[Question Type: Direct Paraphrasing]**

From the passage	Suggested answer
In fact, social media already comes with in-built features that parents can rely on if they are worried about their children's safety online. (lines 34-35)	a) Social media already possess pre-installed aspects/is programmed with capabilities that parents can count on to allay their anxieties about their children's well-being online.
Social media applications generally allow their users, including children, to create private profiles where they cannot be directly contacted and whose content is inaccessible to anyone they have not chosen to 'add.' (lines 35-37)	Additionally, social media applications enable those who utilise it b) to generate personal accounts where they cannot be reached first-hand / whose material is unavailable to strangers (cannot access) OR c) when permission is not given/granted. (no permission)
Applications such as Twitter and TikTok employ extensive content moderating that removes material that is inappropriate for <u>young people's viewing</u> from their feeds, ensuring they will not stumble upon anything untoward. (lines 37-39)	d) Popular applications filter / eliminate content that is unsuitable for consumption <u>for minors</u> X – missing reference to age group
This content moderation can be further enhanced through the use of filters that allow <u>parents and children</u> to customise and refine what content the child will come across while 'scrolling' by blocking content that contains key words or phrases of their parent or child's choosing . (lines 39-42)	e) This content screening can be improved even more by the utilisation of filters that permit users to tailor/revise what images and videos they will encounter OR f) <u>Parents and children</u> can use filters to decide what materials the child can access. X – missing user/parent; need to differentiate from pt d) which is the platform itself filtering content
Any 3 points for 3 marks.	

7. In what two ways is the final paragraph an effective conclusion? [2m] [**Question Type: Use of Stylistic Devices**]

From the passage	Suggested answer
Technology can help but it is us parents who must take the initiative to build an open, honest, and trusting relationship with our children, leading them back to us when they experience something inappropriate online. (lines 48-50)	a) The author uses the personal pronoun “us” and “we” (authorial technique) to connect with <u>parents/make the message more personal to parents/</u> who may be reading this passage.
Technology can help but it is us parents who must take the initiative to build an open, honest, and trusting relationship with our children... (lines 48-49)	b) The author calls for parents to take more positive action , make a positive change in how they address their children's online activities, <u>being more trusting instead of going about it sneakily.</u>
Would that not actually be the most reasonable thing to do? (line 51)	c) The author uses a rhetorical question (authorial technique) at the end of the conclusion to persuade readers that there is a more logical way to oversee their children's online activities.
Technology can help but it is us parents who must take the initiative to build an open, honest, and trusting relationship with our children , leading them back to us when they experience something inappropriate online. (lines 48-50)	d) The author reiterates the earlier point that <u>parents need to build more trusting relations with their children regarding their children's online activities.</u>
Would that not actually be the most reasonable thing to do? (line 51) vs. Sounds crazy? Not to those who consider this a form of cyber-spying! (lines 5-6)	e) The author links the last question back to the initial question posed in the introduction , highlighting how <u>not monitoring children's online activities is not as ridiculous as it first seemed.</u> X – any function stated that is not specific to conclusions (strike a comparison/summarise/ provide a solution)
Any 2 points for 2 marks	

From Passage 2

8. Summarise why it is important for parents to monitor children's online activities. Write your summary in **no more than 120 words**. [8]

	Lifted	Paraphrased
1.	Virtual threats tend remain hidden as children seldom share what they do online with their parents. (lines 1-2)	Parents should monitor their children as the dangers online are often invisible / unseen / concealed
2.	In a world as perilous as today's, such surveillance guards our young ones from a whole plethora of threats . (lines 2-3)	and to protect them from the large amount of / abundance of harm / dangers
3.	It is not only the speed at which children can fall prey to these threats (lines 4-5)	due to how quickly they can succumb to such dangers,
4.	how these threats can spread like an epidemic if left unchecked (lines 6-7)	as well as how far / extensive they can proliferate / grow / expand if uncontrolled.
5.	Young netizens are most of the time not mature enough to tell truths from lies. As a result, they easily succumb to the manipulation and deceit of malicious evildoers on the internet. (lines 7-9)	Children are very susceptible to any trickery / deception on the internet as they are still developing mentally
6.	It only makes sense that keeping tabs on what children do online can ensure that parents can detect and prevent these horrid situations . (lines 9-10)	Thus, parents need to monitor their children to discover and stop / avert such disasters .
7.	we often only imagine children as helpless victims of dangers that lurk on the web. However, the truth of the matter is that they too are equally guilty of causing harm to others . (lines 11-12)	Children can also hurt others / be the perpetrators
8.	parents can be legally charged for their children's criminal behaviour. (line15)	while parents can be held accountable / liable / taken to task by the law for their children's crimes.
9.	their moral obligation to do so. Failure to monitor their children's digital footprints is irresponsible parenting (lines 17 & 19)	It is also the ethical duty of parents to monitor their children.
10.	Moreover, at a younger age, children need parental guidance on what behaviours are acceptable. (lines 20-21)	Children require adult supervision / direction on the right conduct online
11.	sniff out any red flags before it is too late to do anything else about any undesirable circumstances that can arise from living on the internet. (lines 25-27)	It is important for parents to detect / uncover any issues while it is still possible to address them / before there is no longer any action / recourse that can be taken

Mark	1	2	3	4	5	6	7	8
No. of pts	1-2	3	4	5	6	7	8-9	10+

Sample summary

It is vital that parents monitor their children as the dangers online are often invisible. Parents need to protect children from the abundance of dangers online, given how quickly children can succumb to such dangers, as well as how extensively these dangers can proliferate if uncontrolled. Moreover, children are very susceptible to any trickery on the internet as they are still developing mentally. Thus, parents need to discover and stop such disasters from happening by keeping a close watch. It is also their ethical duty. Additionally, younger children require adult supervision on the right conduct online. It is also vital for parents to monitor their children in order to uncover any issues while it is still possible to address them. (120 words, 11 points)

From both passages

9. The reading passages cover a range of views on parents monitoring their children's online activities.

How far do you agree that parents should monitor their children's online activities?

Support your answer with reference to:

- the ideas and opinions from at least one of the reading passages
- examples drawn from your own experience and that of your society.

Examiners' comments for AQ:

General comments: Most students managed to write at least 2 body paragraphs tackling 2 different quotes to show some 'balance' in their responses, however some scripts spent too much time writing a lengthy introduction and compromised on the development of their body paragraphs.

What's done well:

- Choice of quote: Scripts that did better chose clear quotes with a clear argument that they can anchor their analysis on.
- EV: Many students attempted to give relevant Singapore contexts to support why the quote applies/does not apply to their society.
- Examples: Scripts that did better tend to have clearer, concrete examples with some relevant details to fully illustrate/support their arguments.

Areas for improvement:

- Choice of quote: Some scripts did not quote from the passage and hence the paragraph development became unclear as to what the main point was. Some scripts used other quotes from parts of the passages to support their 1st quote – hence most of the paragraphs became a rehash of the author's points and little credit could be given to the students.
- EV: Lacking contextualisation to Singapore → some scripts merely gave a quote but merely explained the quote generically.
- Examples: Lacking concrete, relevant examples → generic, hypothetical examples were given. OR overly personal examples were given without expanding it to the wider population in Singapore. Statistics were sometimes stated without clear links or relevance to the quotes

From Passage 1	[Agree with author] Parents <u>should not</u> monitor their children's online activities in Singapore	[Disagree with author] Parents <u>should</u> monitor their children's online activities in Singapore
Parents run the risk of overreacting to completely harmless online behaviour that they lack the context to understand. (Para 2, lines 14-15)	Given the quicker dissemination of information online, creating new trends and different lingos at faster rates than ever before, parents often feel a bit of a generation gap with their children and may not understand the context of certain behaviour or expressions they see their children exhibiting or posting online. This is especially so in Singapore due to our technologically-advanced society, with many children gaining access to digital devices and online platforms or social media from a very young age - A new survey conducted by Google revealed that the average age that children in Singapore get their first internet-connected device is eight years old, amongst the youngest in the world. Coupled with the fact that many Singaporean families are dual-income, with long work hours , it is increasingly harder for parents to keep up with the changing trends their children are following, and therefore increases the chances of them not having a full picture and end up overreacting. This is undesirable as some psychological studies have shown that such over-parenting with overreactions from parents tend to <u>worsen parent-child relationships as well as lead to higher levels of anxiety in children.</u>	Given how the average age that children in Singapore get their first internet-connected device is eight years old , amongst the youngest the world, and the increasing incidences of internet predators preying on the young and gullible , it is better to be safe than sorry. Especially in a generally more conservative society like Singapore , coupled with declining birth rates and the consequent shrinking of family sizes , it makes sense why parents would pay so much attention to even the littlest of discrepancies on their children's social media feeds to ensure that their precious children are safe from the dangers of the internet. Many conservative parents are also concerned over influences on the internet that may contradict the family or religious values (such as sex before marriage, pro-abortion or homosexuality) they are trying to instill in their children. This is also an extra cause for concern amongst the younger age groups where they are more impressionable and more easily swayed. E.g. In a poll done in 2019 in Singapore, 85% of the children have social media accounts. More worrying, 54% of them were exposed to at least one cyber risk, with 43% victims of cyber bullying, 16% involved in online sexual behaviours, and 12% having chatted online with strangers and meeting them. Most of these children who were at risk <u>tend to have less parental supervision or longer usage of digital devices.</u> Granted, such concern may at times be disproportionate, but the early age at which Singaporean children encounter the internet means that these children may not be mature enough to navigate its dangers. Therefore, with such looming threats online, it would be prudent for parents to exercise more caution and monitor their children's online activities to minimize their exposure to such risks.
Children <u>need</u> to learn how to manage their own online presence (Para 4, lines 29-30) OR	Studies have found that helicopter parents end up communicating to their children in subtle (or not-so-subtle) ways that they will not be safe unless mom or dad is there looking out for them. When these children have to go off on their own, they are not prepared to meet daily challenges. This has further implications when the	While there is a need for children to learn how to manage their online presence independently and parents have the duty to teach children how to be good online citizens, children are still at a very impressionable stage of their lives and need more handholding and guidance. This is especially so as children in Singapore get their

Parents <u>have a duty</u> to teach their children how to be good digital citizens (Para 4, lines 31-33)	children grow up and enter higher education or the workforce, where they are suddenly given more freedom and independence, away from parental supervision. With more dual-income families in Singapore and hectic work schedules, it is increasing difficult for parents to constantly monitor their children's online activities and it is therefore crucial for children to learn how to manage their own online presence, as opposed to relying on their parents to restrict their activities to what are deemed appropriate for them. Many children in this generation are already criticized to be a Strawberry Generation without sufficient life skills, hence parents should not encourage greater reliance on parental supervision but should instead educate and encourage children to self-manage their online activities. Moreover, the Singaporean government is aware of the problem of increasing access to online platforms amongst children and have thus implemented numerous measures to educate the children on cyberwellness. E.g. Singapore schools under MOE have compulsory Cyberwellness and Digital Literacy programmes from primary school all the way until junior colleges during CCE lessons to teach students how to safeguard themselves online and how to look out for signs of internet predators.	first digital device at an average age of 8 years old (one of the youngest in the world), and children at this age are still very vulnerable and susceptible to falling prey to bad actors online. Moreover, as a relatively conservative Asian society, coupled with the fact that we are heavily influenced by the Confucian value of respect for parental authority, many parents take it upon themselves to instill values, ethics and character-development of their children, and would inevitably want to have greater say over what their children can or cannot do – be it online or offline – and expect their children to obey and comply. E.g. To tell parents they should not monitor their children's online activity is a more Western mindset, partially stemming from Respectful Parenting mantras that aim to get parents and child to communicate as equals, but this would not sit well with many Singaporean parents. On top of that, there is a quickly growing percentage of Singaporean youth who are trying their hand at tapping on social media to start their own businesses even at a very young age. Regardless of whether they choose to be influencers, online creators or start their own e-businesses, many children are finding themselves thrust into social media spotlights to promote themselves or their products. Therefore, it becomes even more important for parents to guide their children in presenting themselves on a platform that gives them high public visibility. Given that cancel culture in Singapore has claimed its fair share of young victims in recent years, parents have an even greater responsibility to help their children steer away from the possible outrage of their audiences.
Social media already comes with in-built features that parents can rely on if they are worried about their children's safety online (Para 5, lines 34-35) → the author is implying that parents CAN use such features to guide, but don't need to monitor closely.	Parents should rely on these inbuilt features to safeguard their children online rather than blindly imposing curbs on their children's online activities. Given how Singapore is a technologically-advanced nation, and most people rely on a smart phone or digital device at work, parents in Singapore are also generally more tech-savvy and can easily make use of these in-built features to safeguard their children. Rather than monitoring all their children's texts and activities and end up intruding into their privacy, parents can use apps like	[Rebuttal to the point on the left] Despite the presence of inbuilt features to safeguard children, parental intervention is still needed. Given how Singapore is a technologically-advanced nation, and most people rely on a smart phone or digital device at work, parents in Singapore are also generally more tech-savvy and can easily make use of these in-built features to safeguard their children. However, sometimes, these features are still insufficient as children,

	Google Safe Search to filter out mature content that may not be suitable for children or set a limit to screen time on their child's devices. Being a nation that seeks to support the family unit (be it by the government or NGOs), there are many avenues for parents who are unaware of these features to learn from. E.g. Schools often organise cyberwellness talks for parents, and there are several social media sites (such as Focus on the Family facebook page) and forums for parents to join and seek advice and tips from professionals or other parents. Therefore, parents in Singapore are generally well-supported and able to make use of these features to help set some boundaries for their children's online activities without the need to closely track and monitor.	who are also tech-savvy, can easily find ways to get around it. E.g. A quick search on Youtube or Google yields numerous results on tips and hacks to bypass parental controls set on their mobile phones, or using VPN to hide their browsing history and online behaviours. Also, with the rise of internet predators and more advanced technology, these features and filters <u>may not be able to block all the new websites or applications</u> that are constantly being generated to target the young and vulnerable. Therefore, there is still a need for parents to more closely and constantly monitor their children's online activities as opposed to merely implementing some of these in-built features and then take a backseat
--	--	--

From Passage 2	[Agree with author] Parents should monitor their children's online activities in Singapore	[Disagree with author] Parents should not monitor their children's online activities in Singapore
In a world as perilous as today's, such surveillance guards our young ones from a whole plethora of threats. (Para 1, lines 2-3) or It only makes sense that keeping tabs on what children do online can ensure that parents can detect and prevent these horrid situations. (Para 1, lines 9-10) or sniff out any red flags before it is too late to do anything else about any undesirable circumstances that can arise from living on the internet. (Para 4, lines 25-26)	Indeed, the online world has become perilous due to the ease of access to inappropriate content which is hard to filter completely, such as cyberbullying and predators looking to groom children. Malicious actors can use misleading titles, captions and thumbnails to attract children to click on them, and many websites have weak age restriction tools which children can easily bypass. Furthermore, almost all households in Singapore with children had access to the internet as of 2021, and Singaporean children get their first Internet-connected device at increasingly young ages (the age of eight, below the global average of 10 – Statista). With more parents relaxing their rules to internet access for educational, social and entertainment purposes brought about especially during the Covid-19 pandemic, monitoring what children have access to online will be crucial in guarding them from becoming unsuspecting victims of online threats. E.g. Two Singaporeans teenagers were recently detained by ISA after being radicalized and planning terrorism-related activities. One of the teenagers was radicalized after joining online gaming platform Roblox	[counter to the point on the left] While some monitoring of children's online activities today can be useful to understand the threats out there, it is even more important not to monitor our children's activities constantly/excessively. Parliamentary Secretary for Communications and Information Rahayu Mahzam in 2021 noted that even with IMDA requiring internet service providers in Singapore to offer Internet parental controls to subscribers, it is impossible to prevent all instances of exposure to harmful content due to the 'porous nature of the internet'. Especially with Singapore's high internet penetration rate, more effective long-term solutions should instead be considered, like educating children about online safety. This empowers them to make better decisions independently rather than simply always relying on parents to make judgement calls for them. E.g. Cyber Wellness (CW) education within the refreshed Character and Citizenship Education (CCE) Curriculum implemented progressively from 2021. Starting from primary level, students are taught to verify the credibility of

	where there are servers where the virtual settings replicated actual conflict zones like the ones in Syria and Marawi in the Philippines to spread ISIS propaganda. The two teenagers were radicalized separately but got acquainted through the same extremist channel on messaging platform Discord. This shows how dangers can lurk in even seemingly harmless platforms, therefore warranting the need for closer parental supervision.	online information sources to safeguard themselves in cyberspace.
We often only imagine children as helpless victims of dangers that lurk on the web. However, the truth of the matter is that they too are equally guilty of causing harm to others. (Para 2, lines 11-12)	Many young Singaporeans have smart devices and with Singapore's high internet penetration rate, they are increasingly turning to online means of social interaction and entertainment as loads of interactive games and content are rolled out each day. Instead of being just passive consumers of such content, the online world often becomes an extension of the physical world. Issues which are usually significant in a children's living experience like peer pressure and emotional dysregulation, coupled with the anonymity and disinhibition brought by the internet, can lead to children engaging in acts harmful to others. This justifies constant monitoring of the young's online activities to prevent them from engaging in such acts or intervening for their wellbeing. Also, given that Singapore is a diverse and multicultural society with a plethora of distinct customs and beliefs, extra care needs to be taken to prevent our young from inadvertently offending or disrespecting others from different backgrounds. This care needs to not only be taken in a local context, but also regionally, because our population consists of many foreign nationals who have come from other countries in search of better opportunities, and any offensive comment targeted at these minorities can have larger political implications if it gains traction globally. E.g. A 2022 study in Singapore by public-private tie-up Sunlight Alliance for Action (AfA) showed that nearly half of 1,000 respondents - Singaporeans and permanent residents aged above 15 - have experienced some form of online harm such as being stalked online and cyberbullied. E.g. In a survey of 3,000 secondary school students by Touch Cyber Wellness, one in four secondary school	(if not already mentioned in the previous 'agree' paragraph) As part of Singapore's push to become a smart nation and to continue maximizing the potential of its human resource, much investment is being poured into developing the young in digital literacy from primary school and beyond. This heightens the need and thus the provision of education in Cyber Wellness and how to use technology appropriately – in prosocial and law-abiding ways. This may not totally eradicate all bad actors and instances of harm caused to others, but this will help guide good decision-making and provide students with the knowhow to manage situations if attempted harm happens to them. E.g. Cyber Wellness (CW) education within the refreshed Character and Citizenship Education (CCE) Curriculum has been implemented progressively from 2021. Starting from primary level, students are taught to develop a healthy online identity, develop safe, respectful and meaningful online relationships, have a positive presence in the cyber community and learn about cyber ethics. Peer Support Leaders and form teachers are also trained to support this.

	students admitted that they have bullied their peers online, while one in three said they have been victims of cyber bullying. These ranged from spreading rumours or vicious remarks about a person on social networks, to "defacing" a person's picture and then circulating it online. Because of the disastrous ramifications of such online misbehavior that children are more likely to be perpetrators of, the very first line of defence should be held by parents, who are chiefly responsible for their children's upbringing and conduct.	
Given these dangers, parents are not only justified in monitoring what their children do online, it is in fact, their moral obligation to do so. (Para 3, lines 16-17) or Just as parents look after their children in the real world, they too should be entrusted with the mandate to watch out for their children on the internet or on social media. (Para 3, lines 17-19)	While there is no legal provision for parents to be held criminally responsible if their child commits a crime, Singaporean parents, regardless of their ethnicity, generally play an important role as moral guides and educators for their children. The nuclear family is often seen as the basic building block of society and is where children are first socialised. This is especially important as children may lack the maturity and skills of discernment to make sensible choices by themselves. Parents instill values, ethics, and cultural practices, which can be influenced by Singapore's varied religious beliefs, cultural heritage and personal philosophies. Confucian values and principles of filial piety, respect for authority, and the cultivation of moral character have also been thought to have influenced family dynamics and parental roles in Singapore. Collectively, these are sometimes labelled as 'Asian Values'. Children who behave in socially deviant ways are sometimes chastised as bringing dishonour and shame on their family (colloquial expressions of 'sia suay' or 'malu' apply), and their parents can also be criticised as having not raised their children well. Thus, by extension, in exploring the online world, parents are also expected to be morally responsible for their children's behaviour. E.g. Amos Yee is an infamous Singaporean vlogger who was convicted and fined in Singapore for his online videos which wounded religious feelings, and was also convicted in the USA for possessing child pornography	While parents in Singapore are often expected to play a key role in ensuring their children are brought up well and in accordance with social norms, being held responsible or obligated to watch out for what they do online can be unrealistic. With the rapid advancement and variation of games, chatrooms, social media platforms and streaming sites that children can access, Singapore parents can be technologically inadequate to keep up, especially since many did not grow up in a digital age. Furthermore, Singaporean parents have busy lives, juggling work, household responsibilities, and other commitments. Constantly monitoring their children's online activities can be time-consuming and may not be feasible for all parents. With such a niche and complex problem, entrusting the sole responsibility of monitoring to parents may neglect the role of schools, communities, and policymakers in educating children about online safety and promoting responsible digital citizenship. Parents play a part of the whole network of support for children and should not be the ones primarily responsible for what their children do online. E.g. MOE's Cyber Wellness curriculum focusses on a holistic approach, with a detailed curriculum run in schools and a parent kit for parents to guide them on what to do such that good practices are transferred from school to home. Parents undoubtedly play a significant role, but they are part of the whole chain of support for children in various aspects of their lives with regard to Cyber Wellness.

	and soliciting nude photos from a minor. While his cases were publicised in the media, his mother was regularly put in the spotlight, with many including local celebrities criticising her parenting. She even publicly wrote an apology taking responsibility for “not teaching (him) well”, showing how parents can easily be blamed for their child’s misdeeds. For all the talk about how our Singaporean youth may be far ahead in their social media literacy when compared to parents, Singapore is also witnessing a new age of parents who possess an equally competent level of social media literacy and equally high rate of social media usage. This means that these parents not only possess the expertise in guiding their children on what online activities are safe to partake in but also understand the nuances and subtleties of the interactions of online communities to not be too draconian in their supervision. As such, parents should monitor their children because they have the duty to help their children navigate a virtual world that parents themselves are also navigating, but with a greater deal of maturity.	
--	--	--
